

Temafloor 4000

DESCRIPTION

A solvent-free Temafloor 4000 troweling screed is prepared by adding sand to Temafloor 400 epoxy varnish mixture.

PRODUCT FEATURES AND RECOMMENDED USES

- Due to good impact resistance suitable for e.g. loading platforms, repair shops and market floors.
- Recommended also for floors subjected to steam and heat; e.g. in institutional kitchens and dairies.
- Withstands heavy wear. Resistance to chemicals is given case by case.
- Withstands +110°C dry heat and +60°C in immersion.
- For new and old concrete floors exposed to heavy mechanical and moderate chemical stress in production facilities, e.g. in wood, chemical and food industries.

TECHNICAL DATA

Volume solids

approx. 100 %.

Specific gravity

Approximately 1.8–2.1 kg / l (mixture), depending on the grain size and the amount of sand.

Mixing ratio

Temafloor 400 mixture	3 parts by volume Temafloor 400
	1 part by volume Temafloor 400 Hardener
Screed film thickness 3–6 mm	1 part by volume Temafloor 400 mixture
	3–4 parts by volume of filler sand, e.g. grain size of 0,5–1,2 mm

Note. If 1L Temafloor 400 mixture is blended with 3-4L sand, the volume of final screed mixture will be approximately 3-4L

Note. The amount of the filler and the grain size depends on the object.

Pot life (+23°C)

30–45 minutes on substrate, 15–30 minutes in the mixing container.

Practical coverage

For a flat substrate:
1 mm layer: 1 litre ready for use screed/m²
5 mm layer: 5 litres ready for use screed/m²
Practical coverage depends on the evenness of the substrate.

Drying time (+23°C)

Dust dry after 6 hours
Light trucking after 24 hours
Recoat after 16–24 hours
Fully cured after 7 days

At lower temperature the curing process will last longer.

Cleaning of equipment

Thinner 006 1029.

Finish

High gloss. Sunlight will affect on the shade and the gloss of the varnish in the long run.

Colors

The colour of the screed is determined by the sand used.

Thinning instructions

Do not thin TEMAFLOR 4000 grinding screed.

Reaction to fire

C_{FL}-s1 according to standard EN 13501-1.

Temafloor 4000

VOC

VOC 2004/42/EC (cat A/j) 500 g/l (2010)
Temafloor 4000: max. VOC < 500 g/l

Temafloor 4000

APPLICATION INSTRUCTIONS

Surface preparation	Always remove all grease, oil, and other impurities with Maalipesu detergent before grinding. Remove laitance or old peeling paint layers by power grinding, milling, or vacuum grit blasting. Choose the method best suited for the premises. Clean out pot holes removing all loose or brittle material. Open cracks with e.g. an abrasive tool. After mechanical pre-treatment remove all loose material and dust carefully with a vacuum cleaner. The substrate must have a tensile strength above 1.5 MPa. For application on cementitious leveling screed: check compatibility with the leveling screed manufacturer.
Application conditions	The relative humidity of the concrete should not exceed 97%. Residual moisture content should be below 4 weight-%. The temperature of the ambient air, surface or coating should not fall below +15°C during application or drying. Relative humidity of air should not exceed 80%.
Mixing components	First stir base and hardener separately. Mix the correct proportions of base and hardener thoroughly (approx. 2 minutes to get homogenous mixture) by using a low speed industrial hand drill with a paddle. Insufficient mixing or incorrect mixing ratio will result in uneven drying of the surface, weaken the properties of the coating and risk the success of the application.
Application	By adjustable trowel, serrated trowel, float, levelling trowel and screed box.
Priming	Prime using Temafloor 200, Temafloor 400 or Temafloor 220W epoxy varnish thinned 20–50% with Thinner 1029 or Fontefloor EP Primer epoxy varnish thinned 20–50% with water. Pour the varnish mixture onto the floor and apply as much as is needed to impregnate the concrete surface. If necessary, repeat priming to get a non-porous surface. A porous priming coat will result in holes and air bubbles in the finished coating. Subsequent treatment can be carried out after 2 hours using "wet-on-wet" technique. Scatter sand of grain size 0.5–1.2 mm on the fresh primer coat to ensure the screed adhesion and prohibit gliding of the screed.
Screed	Pour the screed mixture onto the floor. If a thin layer is required, apply by an adjustable trowel to the desired screed thickness. Thick layers are applied by a screed box or by a straight-edge and suitable laths to gauge the required thickness. Trowel the screeded surface by hands or use a suitable lightweight troweling machine. To get a non-porous surface overcoat the screed after 16–24 hrs with Temafloor 210 or 400 epoxy varnish.
Topcoating	Overcoating should be done within 16–24 hrs after priming using unthinned Temafloor 400 epoxy varnish. If the primed surface is not overcoated within 24 hrs, it should be abraded. Pour the mixture onto the floor and apply it with a trowel and level with a roller.

HEALTH AND SAFETY	Containers are provided with safety labels, which should be observed. Further information about hazardous influences and protection are detailed in individual health and safety data sheets. A health and safety data sheet is available on request from Tikkurila Oyj.
